# Nifty50 Stock Analysis 2020 - 2025

## Introduction

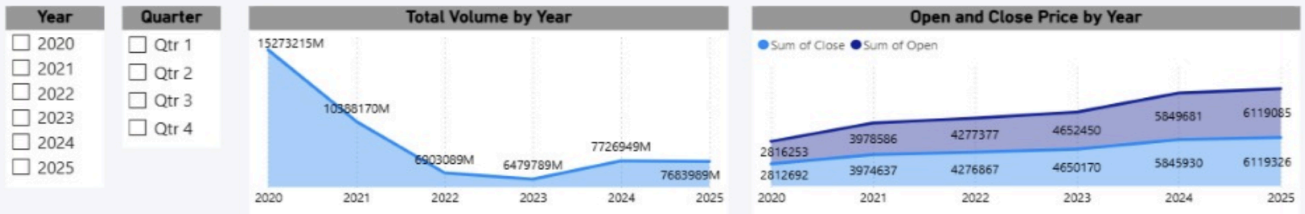

The NIFTY 50 index represents the performance of 50 major companies listed on the National Stock Exchange of India and serves as a key benchmark for understanding overall market trends. This project analyzes historical NIFTY 50 data using Power BI to explore price movements, trading volume patterns, and basic return behavior. By using clean data, simple calculations, and interactive visualizations, the dashboard provides an intuitive and beginner-friendly view of stock market performance.

## Problem Statement

Stock market data contains large volumes of daily price and trading information, making it difficult for beginners and non-technical users to understand overall market behavior and trends. Investors often struggle to quickly interpret how prices, highs, lows, and trading volumes change over time without performing manual calculations or complex analysis. This project aims to solve this problem by developing an interactive Power BI dashboard that visually analyzes historical NIFTY 50 data, enabling users to easily identify trends, price patterns, and market movement through simple, clear, and informative visualizations.
